AQS offers a prompt, effective and safe solution to all sewer and pipe repair needs.

Be it using the latest advanced technology methods — relining or patching — or, where appropriate AQS also offers traditional excavation repair and replacement.

Trenchless 'No Dig' Technology

Trenchless, 'no-dig' or 'relining' is simply the fastest and most cost-effective way to repair a damaged drain or sewer and causes the least disruption. As a result it is also considered to be the most environmentally and financially favourable solution.

Also known as CIPP (Cured-In-Place Pipe), it is the established form of repair for dilapidated infrastructure assets.

AQS has carried out many pioneering sewer reline projects. Working on pipes, drains, sewers and culverts ranging from 100mm in diameter, right up to a massive 2500mm.

'Ultraviolet' Light Cured Linings

The very latest in trenchless technology: Ultra Violet. AQS UV liner is an innovative and bespoke fibre-glass product and installation technique. It's fast: using UV (ultra violet) light the lining will cure in less than 1-metre per minute. And it's durable: once cured the UV lining has a design life of 120 years.

Patch Repair

There may be situations when excavation isn't necessary but neither is the installation of a full liner. With AQS there is another way to repair your sewer, drain or pipe - patch it. The process of patch repairing a sewer is similar to that of relining but, as the name suggests, it involves installing a short liner in a specific section of the sewer or drain rather than lining the whole pipe.

After curing, the patch is inspected by CCTV and any lateral connections re-opened using similar techniques to those for full-length liners, before the pipe is recommissioned for use.

**Delivering
the best service for:**

- Jetting + Vacuum
- Repair & Rehabilitation
- CCTV Surveying
- Blockages
